

Evolution in perceptions of COVID-19 pandemic misinformation and population's political preferences

Republic of Moldova
October 2020

Research methodology

- Sample size:** 1001 people aged 18 and above;
- Sample:** stratified, probabilistic, bistadial;
- Stratification criteria:** 13 geographical regions that coincide with the former counties, prior to the administrative reform; urban and rural residential environment; 2 sizes of urban areas; 3 types of rural locations based on population number.
- Sampling:** Size of urban and rural layers and administrative unit results (former counties) have been proportionally calculated based on the population size as provided by the National Bureau of Statistics of the Republic of Moldova.

Considering workforce migration patterns, the regional population distribution which shaped the sample design was adjusted accordingly, based on the data collected by the National Bureau of Statistics via the workforce form.

Randomization levels:

1. *Location:* within the adjusted layers, determined locations (86) have been selected randomly, based on a table with random numbers
 2. *Family:* maximum number of interviews per sampling site has been capped at 5. Interviewed families have been chosen randomly, applying a statistical predetermined step.
 3. *Person:* In case of multiple adults in the interviewed family, the interviewee was established based on the nearest date of birth.
- Representativeness:** the sample is representative of the Moldovan adult population, with a maximum error margin of $\pm 3.1\%$
 - Data collection period:** 10-17 October 2020. The interviews were conducted by telephone. The questionnaire was written in Romanian and Russian, giving respondents the opportunity to choose one of the two languages.

Following the structural analysis of the sample obtained in the field, the match between the population distribution recorded in statistical data and in field obtained data was established, within the limits of admissible statistical deviation.

Females were overrepresented, while youth between the age of 18 and 29 were underrepresented. The main cause of the deviation is explained by workforce migration patterns. The results were adjusted, in order for the sample structure taken into account to represent the distribution average between official statistic data and field obtained data. Thus, the presented **results are adjusted**. The difference between adjusted and unadjusted question results does not exceed 1.5%.
